

Abstract of the Disclosure

The modular turret cage is used with a capping machine adapted to apply closures to containers, such as beverage, food, or water containers. The capping machine includes a stationary cap. The modular turret cage has a top end and a bottom end. The top end of the turret cage is rotatably received in the stationary cap. The turret cage includes a top mounting plate at the top end of the turret cage and a base mounting plate at the bottom end of the turret cage. A plurality of panel sections extends between and connects the top mounting plate and the base mounting plate. The panel sections are fixedly connected to the top mounting plate and the base mounting plate and are separately removable from the top mounting plate and the base mounting plate.
